

Launch readiness

Pre-launch checklist

Seven items stand between Brikk and a clean public launch. Three are critical and block launch. Four are important but ship-able — fix in week one to avoid email deliverability decay over time.

Each item explains what it is, why it matters, what to actually click, and how to verify it worked. Work top-down. The order is the optimal sequence.

Critical	3 items	Block launch
Important	4 items	Fix in week 1
Estimated time	~75 min	If everything works first try

Printed for: _____ Date: _____

1. ■ Add CRON_SECRET to Vercel and redeploy

CRITICAL

WHAT THIS IS

A **cron** is a server task that runs automatically on a schedule. You have one — `app/api/cron/morning-brief/route.js` — that fires every day at 14:00 UTC (7 AM Pacific). It loops through every user and sends them a personalized email about their pipeline. The cron URL is locked behind a password called `CRON_SECRET` so randoms on the internet can't hit it 1000 times and burn through your Anthropic API budget.

WHY IT MATTERS

Without the secret, Vercel's scheduler still pings the URL every morning — but the route rejects every request, so zero morning briefs go out. The marquee feature is silently broken. Vercel knows the password and includes it in the request header; strangers don't, so they get blocked.

WHY THIS IS BROKEN RIGHT NOW

The pre-launch audit found `CRON_SECRET` is missing from Vercel's environment variables. Resend's dashboard confirms zero morning-brief emails delivered since the cron was wired up.

HOW TO FIX

- 1 Open **Vercel** → your Brikk project → **Settings** → **Environment Variables**.
- 2 Click **+ Add New**.
- 3 Key: `CRON_SECRET`. Value: a 32+ character random string. Use 1Password's generator (<https://1password.com/password-generator>) or run `openssl rand -base64 32` in Terminal. **Save the value in your password manager.**
- 4 Check both **Production** and **Preview** boxes.
- 5 Click **Save**.
- 6 Go to **Deployments**, find the most recent one, click the ■ menu, click **Redeploy**.

✓ Done when: Tomorrow at 7 AM Pacific, Resend's dashboard shows morning-brief emails being delivered. Or smoke-test now with: `curl -X GET https://brikk.store/api/cron/morning-brief -H "Authorization: Bearer YOUR_SECRET" — should return ok:true.`

2. ■ Run enable-realtime.sql in Supabase

CRITICAL

WHAT THIS IS

Supabase has a **realtime** feature where the database tells your app the instant a row changes, instead of your app constantly asking 'anything new?'. Brikk uses this for the 'new lead just came in' toast — the moment a prospect submits your `brikk.store/r/YOUR-CODE` form, the toast appears on whatever page you're on.

WHY IT MATTERS

For realtime to work, each table must be on a special list called `supabase_realtime`. Inserts still work without it — but the database doesn't broadcast the change, so your app never finds out and the toast never fires. You're staring at the screen waiting for a notification that never comes.

WHY THIS IS BROKEN RIGHT NOW

The audit confirmed both `Leads` and `messages` tables are NOT in the realtime publication. Your 'instant response' promise is silently broken — leads come in, but nothing alerts you.

HOW TO FIX

- 1 Open **Supabase** → your Brikk project.
- 2 Left sidebar → **SQL Editor**.
- 3 Click + **New query**.
- 4 Open `sql/enable-realtime.sql` from the brikk-store repo. Copy the entire file contents.
- 5 Paste into the SQL Editor.
- 6 Click the green **Run** button (or `Cmd+Enter` on Mac, `Ctrl+Enter` on Windows).

✓ *Done when: Results panel at the bottom shows two rows: `Leads` and `messages`. Then test live: have someone fill out your `/r/YOUR-CODE` form while you're staring at `/app/leads` — toast should appear without refresh.*

3. ■ Locate where `RESEND_API_KEY` actually lives

CRITICAL

WHAT THIS IS

An **API key** is a long secret string — basically a password for a service-to-service connection. `RESEND_API_KEY` lets the Brikk server talk to Resend (the email-sending service) on your behalf. Without it, Resend rejects sends. The audit confirmed emails **are** going out (one was delivered 37 minutes before the test), so the key is working somewhere — just not where you'd expect.

WHY IT MATTERS

If you assume it's in Vercel and try to update it from there, nothing changes and you can't figure out why. Or worse — you might delete a Vercel variable thinking it's the active one, and the working pipeline keeps running on the hidden one until you can't troubleshoot. You need ONE source of truth.

WHY THIS IS BROKEN RIGHT NOW

The audit found no `RESEND_API_KEY` in Vercel env vars, yet emails work. The key likely lives in Supabase Auth SMTP settings or Edge Function secrets. You need to find out which.

HOW TO FIX

- 1 Open **Supabase** → **Authentication** → **SMTP Settings**. Look for the SMTP password field (masked as `.....`). That's where Resend API keys usually live when you configured Supabase to send auth emails via Resend.

- 2 Then check **Project Settings** → **Edge Functions** → **Secrets**.
- 3 Then go BACK to **Vercel** → **Environment Variables** and **scroll the full list manually** — don't use search (the audit caught a stale 'removed' toast on that page).
- 4 Wherever you find it, write it down: *'Brikk Resend key lives in: [location], last updated [date]'*. Save in your password manager.

✓ *Done when: You can answer the question 'if I have to rotate the Resend key tomorrow, where do I update it?' in ONE location, not three.*

4. ■ Set Supabase Site URL to <https://brikk.store>

IMPORTANT

WHAT THIS IS

Site URL is what Supabase puts at the front of any link inside an auth email (confirm signup, reset password, magic link). If Site URL is `https://yourproject.supabase.co`, then every link in your branded Brikk email points to `supabase.co`.

WHY IT MATTERS

Gmail and Outlook spam filters compare the From domain to the link domain inside the email. If they don't match — From says `brikk.store` but the click-link says `supabase.co` — that's a major spam signal. It hurts inbox placement and over time pushes your emails into Promotions, then spam.

HOW TO FIX

- 1 Supabase → **Authentication** → **URL Configuration**.
- 2 **Site URL** field: change to `https://brikk.store`.
- 3 **Additional Redirect URLs**: add `https://brikk.store/auth/callback` if not already there.
- 4 Click **Save**.

✓ *Done when: Sign up a new throwaway email. The 'Confirm my account' link in the inbox should start with `https://brikk.store/auth/callback?...`, NOT `supabase.co`.*

5. ■ Publish a DMARC TXT record

IMPORTANT

WHAT THIS IS

DMARC stands for Domain-based Message Authentication, Reporting, and Conformance. It's a public note attached to `brikk.store` telling Gmail/Outlook: 'if an email claims to be from `brikk.store` but didn't actually come from my servers, here's what to do with it.' Lives as a TXT record in your DNS settings (wherever `brikk.store` is registered).

WHY IT MATTERS

Missing DMARC won't bounce your emails today, but slowly degrades inbox placement. Six months in, your emails start landing in Promotions or spam at scale, and you'll never figure out why. DMARC also

blocks spammers from spoofing your domain.

HOW TO FIX

- 1 Figure out where brikk.store is registered (Namecheap, GoDaddy, Cloudflare, etc.). Check your domain-purchase email if you forget.
- 2 Log into that provider, go to DNS settings for brikk.store.
- 3 Add a new **TXT record**: Name/Host = `_dmarc` · Value = `v=DMARC1; p=none; rua=mailto:dmarc@brikk.store` · TTL = 1 hour (or auto).
- 4 Save and wait ~30 minutes for propagation.

✓ *Done when: Go to <https://dmarcian.com/dmarc-inspector/> and enter brikk.store — your record should appear. Note: `p=none` means monitor-only — emails still flow as before. Upgrade to `p=quarantine` after 2 weeks of clean reports.*

6. ■ Update Supabase SMTP Sender email to hello@brikk.store

IMPORTANT

WHAT THIS IS

Controls the From address shown in the recipient's inbox when Supabase sends an auth email. Currently set to `noreply@brikk.store`. We want `hello@brikk.store`.

WHY IT MATTERS

noreply@ is bad for three reasons: (1) Spam filters score noreply addresses lower because spammers use them. (2) Users hate them — 'no reply' reads as cold and impersonal. (3) When a user does reply (and they will), the email bounces or vanishes — bad UX. **hello@** is monitored, replies reach you, Resend specifically recommends it.

WHY THIS IS BROKEN RIGHT NOW

I already changed the default in `lib/email.js` so agent-branded lead confirmations use `hello@`. Supabase auth emails are configured separately in the dashboard.

HOW TO FIX

- 1 Supabase → **Authentication** → **SMTP Settings**.
- 2 Find the **Sender email** field (sometimes labeled 'From email' or 'Sender address').
- 3 Change `noreply@brikk.store` to `hello@brikk.store`.
- 4 Optionally change Sender name to Brikk if not already.
- 5 Click **Save**.

✓ *Done when: Sign up a fresh email. Confirmation should come from Brikk <hello@brikk.store>, not noreply@.*

7. ■ Verify hello@brikk.store sends and receives mail

IMPORTANT

WHAT THIS IS

Two-part verification: (a) Resend lets you send FROM hello@brikk.store (verification is at the domain level, so this should work automatically if brikk.store is verified). (b) Replies to hello@brikk.store actually reach a mailbox you read (requires inbound forwarding via ImprovMX or Cloudflare Email Routing).

WHY IT MATTERS

If sending works but receiving doesn't, the whole reason to use hello@ over noreply@ collapses — replies vanish. Setting both up makes your email pipeline trustworthy in both directions.

HOW TO FIX

- 1 Resend → **Domains** → click brikk.store. Confirm **DKIM** and **SPF** both show ✓ verified.
- 2 If either is unverified, follow Resend's DNS-record instructions to fix.
- 3 Set up inbound forwarding: go to **improvmx.com** (free) or your DNS provider's email routing feature. Configure hello@brikk.store → forward to hmdesrosier@gmail.com.
- 4 Test send: from a personal email, send a message to hello@brikk.store. Should arrive in Gmail within a minute.

✓ *Done when: (a) New signup confirmation lands from Brikk <hello@brikk.store>. (b) A reply to that email reaches a mailbox you actually check.*

Launch sign-off

Once all seven items are checked, Brikk is launch-ready.

Foundation status (from pre-launch audit):

- ✓ **Database schema.** All 6 tables present, RLS enabled, triggers and functions in place.
- ✓ **Anthropic AI.** API key live, help chat responding accurately.
- ✓ **Branded email.** Resend pipeline working, template renders correctly.
- ✓ **Marketing site.** Loads under 2s, zero console errors, all copy correct.
- ✓ **Edge-case pages.** 404, bad-ref, missing-agent all branded and don't leak data.
- ✓ **Stripe checkout.** Webhook live, idempotent team creation, 14-day trial enforced.
- ✓ **Customer Portal.** Endpoint wired, settings UI shows Manage button for subscribers.
- ✓ **Apple Pay.** Domain verification file route in place (needs env var from partner).

Once items 1–7 are complete, the integration gaps are closed. The architecture is sound — these were the last loose ends.
